How to do reverse image search on desktop

Searching for the original source of an image you like online? Many start with Google Image Search. Want a complete list of all the pages your image appears in on the web? Here's your complete guide to reverse image search on today's major search engines: Google Bing Yandex TinEye Bonus: we'll show you how to do reverse search on both desktop and mobile. Let's get started. What Is Reverse Image Search? Reverse image search is pretty cool. It's a lot like a regular keyword search, but this time it's with images. Reverse image search lets you explore an image in-depth. It gives you details on the image's size, what the image is, and where you can find it online (the exact pages with links). Why Use Reverse Image Search? Reverse image search is fun to do when you have a few extra minutes sitting at your computer. But it's extremely useful as well. You can use it to: Find interesting facts about an image you like. Learn the copyright status of an image before using it. Track copyright violations on images you're already using. Find out if other people are using your images. Why Reverse Image Search Sometimes Doesn't Work Reverse image search doesn't work every single time. There are times when you'll upload a photo on the search bar and get zero results. When this happens, it's likely because the website on which the image appears prevents images from being indexed. Also, data centers can be slightly out of sync. This means some users can find the image using reverse image search while others can't. How to Do Reverse Image Search on Today's Major Search Engines The amazing thing is you can use your favorite search engine (Google, Bing, Yandex) to perform reverse image search. If you want to use a search engine created specifically for reverse image search, you can go ahead and use TinEye. Remember, it doesn't matter whether you're using a Mac or PC, or what browser you use (Chrome, Firefox, Safari, Edge, etc. work just fine). How to Do a Reverse Image Search on Google (Desktop) 1. Open Google on a Compatible Browser Reverse image search works on Safari, Firefox, and Chrome. Once you have access to a browser, open Google Images. 2. Upload Your Image If you found an image online that you would like to look up, one option before doing a reverse search is to save it to your desktop. Then, once you have opened up Google Images, go to the right side of the search bar and click the camera icon. Upload your picture by either dragging and dropping it into the search area or by loading the file from your desktop. Note: you can only search for one image at a time. 3. Upload the URL with the Photo If the image is not saved to your desktop, you can also click on the Google image's camera icon again to paste the photo's URL. To get the photo's URL, right-click the image with your mouse and select the option "open image in new tab." Highlight the URL in the website's search bar and simultaneously hold down the "command" and "C" key to copy the text. Then, click the "Paste image URL" tab. Insert your copied URL into the available space. 4. Explore Your Results Once you click "search," you will see your uploaded photo at the top of the page along with some suggested keywords. Next to the image, Google will also tell you if there are other sizes of the image available for you to download. From there, you can explore similar images or websites that contain the photograph. How to Do a Reverse Image Search on Google (Chrome App on a Mobile Device) Need to do a quick reverse image search when you're on the go? Here's how to do it without turning on your computer. 1. Open Google Images in Your Chrome App Using the app is an easy way to use reverse image search on your phone if you're pulling a picture from the web. Open your Chrome app and pull up Google Image Search. 2. Search for Your Image Type the image you were looking for into the search bar and click "enter." A list of photographs will appear. Tap your desired image. 3. Select "Search Google for this Image" After you open the image on your phone, click and hold on the picture. A drop-down menu will appear with several options. Click the bottom tab that says, "Search Google for This Image." 4. Explore Your Results A new tab will open in Chrome, showing you where else the image is located and different sizes available. How to Do a Reverse Image Search on Google (Mobile, in a Browser) 1. Open Google Images in Your Web Browser The easiest way to do a reverse search on your phone is to download the Chrome app as outlined above, but it is possible to do it in your browser. The first step, naturally, is to open Google Images in your browser. 2. Get Rid of Your Mobile View You'll notice that, once you pull up Google Images on your phone, there is nowhere to search an image. To obtain that feature, change the website settings to the desktop view. Click the double "AA" icon in the top left corner of the search bar. Select the third option on the drop-down menu that says, "Request Desktop Website." This will change the screen to look like the Google browser you would traditionally see on your computer. 3. Upload an Image Click the camera icon on the right side of the Google Images search bar to explore your reversed image. When you click the button two options will appear: "Paste image URL" and "Upload an image." If the image is uploaded on your camera roll, select "Upload an image," click "Photo Library" and select your picture. The browser will then upload the photo for you. You can also choose from taking a photo or browsing your previous documents or screenshots when uploading a file. Or, Paste the Image URL If you don't have the image saved on your phone, select the "Paste image URL" tab. To obtain your picture's URL, open the photo in your browser, hold the image down and select "copy." After, paste your URL into the URL upload tab. 4. Explore Your Results After you either upload your image and the URL, click the search icon. The website will show you related searches, other available image sizes and websites with the same picture. How to Do Reverse Image Search on Google (iPhone) Open your browser and go to images.google.com. If you're using Safari, click on the Share icon. If you're using Chrome, look at the bottom-right of your screen for the three dots and click that. Select Request Desktop Site. Upload your image to see the results. How to Do Reverse Image Search on Bing Click on the Images option on the top left side of Bing's homepage. Select Search using an image on the search bar. Your options are to drag an image into the search bar, upload an image, paste a URL or image, or take a photo. Note: Unlike with Google, you can drag more than one image into the search bar! Here are the results for a photo uploaded from desktop. You can click on tabs to view pages where the image appears, similar images, and related searches. How to Do Reverse Image Search on Yandex On Yandex, click images on the top left of the search bar. Click on the camera icon. You'll get the option to enter your image's URL or upload a photo from your desktop. Let's say you decide to save and then upload the photo from desktop. You'll get results like these. Notice how detailed the image size details are? If you scroll down, you'll see similar images and a list of all the pages where the image is displayed. There's even a Recognize Text button that allows you to search or translate the words in the image. How to Do Reverse Image Search on TinEye TinEye is the search engine where you can do quick, no-nonsense reverse image search. To start, click the upload button on the left side of the search bar to browse from your desktop's saved images. Or paste the image's URL into the search bar. You can also drag and drop an image from an open browser tab straight into the TinEye homepage! When you're done, you'll get results like these. The cool part is you can use a filter to search by image size, newest or oldest post, best match, and most changed. You can also filter by domain or collection to narrow down your results. Reverse Image Search: The Easy Way to Get Relevant Details About Images There's a ton of reasons why you'd want to know more about an image. You want to know if you can post it on your site. You want to know who's using your images. You're just curious about an image you like. The good news is you can now do it with any browser or search engine you choose. It's easy to do on Mac or PC, iPhone or Android, mobile, or desktop. Have fun! More Resources: Image Credits All screenshots taken by author, May 2020 Image search is an incredibly powerful tool, allowing you to discover amazing images from thousands of different sources around the internet. And image SEO is a pretty big deal, right now. But what if you are in the reverse situation? You have found an image, whether it is a photograph, artwork, or even a graph, and you want to know where it came from, or more about it? This is where reverse image search comes into play. In this guide, I will talk you through exactly what a reverse image search is, how to carry one out and share examples of when you might need to use this process, specifically looking at: Performing a reverse image search allows you to take an image and find where it was originally published, other pages that have published the same image, different sizes of the same image used, and similar images. You are essentially using an image in place of a text-based search query when you are doing a reverse image search. A reverse image search will show you a list of search results like normal text-based queries. Rather than a gallery of images, it will show you the pages that this image has been used on, a link to an image search feature for similar images, and a possible related search. And there are several ways to perform a reverse image search, whether it is on mobile or desktop. These can be done on Google and Bing, other search engines, and by using relevant tools. So let's look at how you can perform a Google reverse image search on desktop, then run you through reverse image search on mobile devices, such as iPhone or Android phones, before showing you how to use other search engines and third party reverse image search tools. I will also touch on different ways you can use a reverse image search when you combine it with our backlink analytics or brand monitoring tool. How to do a Reverse Image Search on a PC or Mac Performing a reverse image search on a PC or Mac, in a desktop browser, is a relatively simple process to undertake that can be done in just seconds. There are two options to do this, depending on whether you are using Chrome or another browser. I will run through both. How to do a Reverse Google Image Search on Desktop Browsers This method works when you have a browser open and have loaded up the Google Images search page. Navigate to the Google Images main page. In the search bar, click on the camera icon with the alt 'search by image'. This will give you a new search display offering you two options. Option 1 is 'Paste Image URL', which allows you to use the URL from an image you have found on the internet. Option 2 is 'Upload an image', which allows you to upload an image from your computer to use as the search item. Whichever option you choose, after entering the URL or uploading the image, you simply click search to display the results: Google Reverse Image Search Using Chrome If you are using Chrome, you can find the source of an image online without having to go through the process above. This method is for images that are already uploaded that you have found while you are browsing online. Locate the image you want to search on the page where you originally found it. Right-click on the image. Select 'Search Google for image'. Google will then display the results of your search as above. Reverse Image Search Using Bing It is always worth remembering that other search engines are out there, and Bing is one of the main options. Bing has its own reverse image search functionality on desktop, called Visual Search, and it works like this: In the Bing search bar, click the Visual Search button. This is the dot surrounded by four corner lines. It will open a pop-up menu. This menu will give you a selection of options to choose from: Upload — this allows you to drag an image into the box and upload it from your computer. It allows you to upload more than one image at a time. URL — search by pasting the URL of the image. Take a photo — this allows you to use your webcam to take a photo. View your results. Bing Visual Search focuses on the image and its attributes before displaying the pages the image can be found on and displaying similar images. It also pulls any text out of the image and offers suggested searches. Reverse Image Search Using Yandex Yandex is another popular search engine that has the ability to perform reverse image searches. Here is how to do it: Select the 'images' tab from the menu above the search bar on the Yandex homepage. Click on the camera icon to the right of the search bar. This will give you two options: Upload a file (or drag and drop) Enter a URL Your results will be displayed. Yandex's reverse search results will primarily display information about that image, including size, potential searches it relates to, text it can identify from the image, and similar images. It then displays the sites it has appeared on further down the page. Reverse Image Search Using Third Party Websites There are a number of sites that specialize in performing reverse image searches on desktop. Some, as you would expect, return better results than others. I am going to review one of my favorites; I recommend trying out if you want to use a tool or app. TinEye.com works in exactly the same way as the normal Google reverse image search, in that you upload an image or add a URL. There are paid functions that can allow you to track an image's usage, amongst other things. TinEye.com also has a plugin available for some browsers. Another third-party site is SmallSEOTools.com, which has a similar process to TinEye.com and Google reverse image search. You can run a reverse image search on their easy-to-use interface that offers quick answers if you need any assistance as well. Plus, you can easily find or add an image by: Entering Image URL Uploading an image Searching with keyword How to do a Google Reverse Image Search on a Mobile Device Performing a reverse image search on a mobile device such as an iPhone or Android phone or tablet is a little different from a desktop. On both Apple and Android devices, you need to have the Google Chrome app installed to access the Google reverse image search feature or use an app that is specifically designed for the function; it won't work on Safari or in another mobile browser. Reverse Image Search Using the Google Chrome App As the camera icon isn't available on the search bar on the Chrome app, there are two options that act as a workaround, either by forcing the desktop version or using a version of the right-click method. Request the desktop version: Browse to images.google.com. Tap the three-dot menu in the bottom right-hand corner of the screen. Select 'request desktop site'. Follow the desktop instructions using the camera icon in the search bar, either using an image URL or by uploading an image. The mobile 'right-click' method: Browse to the page that has the image you want to search for. Press and hold on the image until a menu pops up. Select 'Search Google for This Image'. It is important to note that this method works for images you find through a normal Google image search as well. Reverse Image Search Using Other Apps There are a number of other apps that allow you to perform reverse image searches on a mobile device. These vary from official Google apps to those created by third parties. Google Lens Google Lens is a standalone app on Android phones, and it has functionality available on the Google app or Google Assistant app on iOS. It has a number of uses for different tasks, and you can use it to perform a reverse image search if you need to. This isn't really what it is designed for, though, so it is not the best use of the app. The following are third-party apps that all allow you to perform a reverse image search on either iOS or Android devices, generally, in the same way, you would perform one on desktop — either using a URL or uploading a picture. These apps allow you to look at reverse image searches across different search engines, not just Google. These include Bing and Yandex, among others. Uses for Reverse Image Search Reverse image search can have a number of different uses, some of which are simply fun, but a few of them can help you perform powerful tasks. A few simple uses for a reverse image search are as follows: Find similar images — this can be useful for creating content or finding a particular image. Find the dimensions and metadata of an image. Pull text and translate it. Discover if people are using your images, and how. This is great as part of a wider link building and backlink analysis process, while also important for brand monitoring. Check for copyright violations. This can work for your own images, or you can check whether the image you have found is under copyright. Editors checking for spun guest content — typically, if a writer uses a graphic, they tend to rewrite the content around that graphic, and they don't always give credit to the author (this is not okay). Finding an image source to give credit. Anytime another person's images or graphics are used, you must give credit to the source. If you have forgotten where it came from, you can find it with a reverse image search and make sure you have the right to use it. If you do, you should link to the source. While reverse image search can be fun to play around with, it can be a very effective tool to use as part of a wider marketing strategy. You can use it to monitor campaigns, build links, and monitor your brand. We recommend using it with a combination of our Backlink Analytics and also our Brand Mention Tracking tool for these same purposes. You may be able to track down a number of link opportunities that you had previously missed.
